

### **chapter 9 simple linear pdf**

216 CHAPTER 9. SIMPLE LINEAR REGRESSION variable each time, serial correlation is extremely likely. Breaking the assumption of independent errors does not indicate that no analysis is possible, only that linear regression is an inappropriate analysis. Other methods such as time series methods or mixed models are appropriate when errors are correlated.

### **Chapter 9 Simple Linear Regression**

Simple Linear Regression 223 is never known -- instead the analyst measures the 10 data points and estimates a linear relationship from those points. The OLS estimate developed from the 10 measurements is shown as the dashed line in figure 9.2. Figure 9.1 True linear relation between x and y, and 10 resultant measurements.

0. Introduction 1. Multivariate normal 2. Normal linear models 3. Generalized linear models Normal linear models A simple example of normal linear model is the simple linear regression model where  $X = \begin{pmatrix} 1 & 1 \\ \vdots & \vdots \\ 1 & x_1 \\ \vdots & \vdots \\ 1 & x_n \end{pmatrix}$  and  $Y = \begin{pmatrix} y_1 \\ \vdots \\ y_n \end{pmatrix}$ . It is easy to see that there is a conjugate, multivariate normal-gamma prior distribution for any normal linear model.

### **Bayesian Inference Chapter 9. Linear models and regression**

9.2 Linear Regression If there is a significant linear correlation between two variables, the next step is to find the equation of a line that best fits the data. Such an equation can be used for prediction: given a new x-value, this equation can predict the y-value that is consistent with the information known about the data.

Chapter 9 Regression Wisdom 109 5. Good model? a) The student's reasoning is not correct. A scattered residuals plot, not high  $R^2$ , is the indicator of an appropriate model. Once the model is deemed appropriate,  $R^2$  is used as a measure of the strength of the model.

Nolan Miller Notes on Microeconomic Theory: Chapter 9 ver: Aug. 2006 Figure 9.5: Non-Linear Pricing To illustrate non-linear pricing, consider a consumer who has demand curve  $P = 100 - Q^2$ , and suppose the monopolist's marginal cost is equal to 10. At a price of 90, the consumer demands 10 units of output.
