Dynamic programming, was developed at the same time, primarily to deal with optimization in discrete time. Dynamic programming has already been explored in some detail to illustrate the material of Chapter 2 (Example 2.32). The third approach to dynamic optimization extends the Lagrangean technique of static optimization to dynamic problems.

We approach these problems from a dynamic programming and optimal control perspective. We also study the dynamic systems that come from the solutions to these problems. The course will illustrate how these techniques are useful in various applications, drawing on many economic examples.

Dynamic Programming 11 Dynamic programming is an optimization approach that transforms a complex problem into a sequence of simpler problems; its essential characteristic is the multistage nature of the optimization procedure.

an optimization approach to perform the firm's own demand estimation, its competitor's price prediction and finally its own price setting. Finally, in Section 4, we conclude with conclusions and open questions. 2 Pricing in a Noncompetitive Environment In this section we consider the dynamic pricing problem in a non-competitive environment.
