3 Course Code Title Credits USST501 PROBABILITY AND DISTRIBUTION THEORY 2.5 Credits (60 lectures ) Unit I : PROBABILITY I (i) Basic definitions: Random Experiment, Outcome, Event, Sample Space, Complementary, Mutually Exclusive, Exhaustive and Equally Likely Events.

### **UN IVER SITY OF MUMBAI**

To obtain a wider set of results through the Power and Sample Size functionality, it is possible to include more than one number in some of the boxes. For example, in the Power values box, entering  $\hat{\alpha}0.8:0.9/0.02\hat{\alpha}$  will result in power computations from 0.80 to 0.90 in increasing units of 0.02, as shown in the third column in Figure 3.

The choice of  $n = 30$  for a boundary between small and large samples is a rule of thumb, only. There is a large number of books that quote (around) this value, for example, Hogg and Tanis' Probability and Statistical Inference (7e) says "greater than 25 or 30". That said, the story told to me was that the only reason 30 was regarded as a good boundary was because it made for pretty Student's t ...

### **What references should be cited to support using 30 as a**

Time is one of the major considerations throughout project management life cycle and can be regarded as one of the most important parameters of a project and the driving force of project success.
