Philips Semiconductors The I2C-bus and how to use it (including specifications) April 1995 5 The I2C-bus is a multi-master bus. This means that more than one device capable of controlling the bus can be connected to it.

The I C-bus and how to use it (including specifications)

Each I2C bus consists of two signals: SCL and SDA. SCL is the clock signal, and SDA is the data signal. The clock signal is always generated by the current bus master; some slave devices may force the clock low at times to delay the master sending more data (or to require more time to prepare data before the master attempts to clock it out).

"Mastering the I2C bus" is a clear, concise overview of the I2C protocol. It details electrical requirements, implementation, and common pitfalls and covers a small sampling of devices. While it is true that a lot of this material is available elsewhere, the book presents the material as a cohesive whole.

I All slaves are controlled by the master clock I C is a -Slave protocol I2C is a Master-Slave protocol. Normally, the master device controls the clock line, SCL. This line dictates the timing of all transfers on the I2C bus. Other devices can manipulate this line, but they can only force the line low. This action means that item on the bus can not

bus as the communication channel, the master controller will be able to send and receive data to and from the slave. In order to show the design of the I2C master bus controller as simply as possible for ease of understanding, some of the subtle details of the I2C specifications are not fully implemented.

Implementing an I2C Master Bus Controller in a FPGA

Inter-Integrated Circuit, abbreviated as I2C is a serial bus short distance protocol developed by Philips Semiconductor about two decades ago to enhance communication between the core on the board and various other ICs involved around the core.
