Titration, also known as titrimetry, is a common laboratory method of quantitative chemical analysis that is used to determine the concentration of an identified analyte. Since volume measurements play a key role in titration, it is also known as volumetric analysis. A reagent, called the titrant or titrator is prepared as a standard solution. A known concentration and volume of titrant reacts ...

Titration problems for An Introduction to Chemistry by Mark Bishop. Molarities of acidic and basic solutions are often used to convert back and forth between moles of solutes and volumes of their solutions, but how were the molarities of these solutions determined?

Complexometric titration (sometimes chelatometry) is a form of volumetric analysis in which the formation of a colored complex is used to indicate the end point of a titration. Complexometric titrations are particularly useful for the determination of a mixture of different metal ions in solution.

Chapter 5 36 Complexometric Titrations Complexometric titrations are based on the formation of a soluble complex upon the reaction of the species titrated with the titrant.

Titration is a type of quantitative chemical analysis. It is used to work out the unknown concentration of a known substance. It makes the use of two main chemical apparatus namely, pipette and burette. External indicators like phenolphthalein or methyl orange and internal indicators like KMnO₄ (potassium permanganate) are used to mark the end point of titration.
